

Spotlight on 3 Years of CDC's Colorectal Cancer Control Program

CRCCP Reach After 3 Years

221
Health Systems

679
Clinics

5,436
Providers

1,135,719
Patients aged
50–75

During the first 3 years of the CRCCP, awardees worked with 679 clinics from 221 health systems that serve over 1.1 million patients ages 50 to 75. The majority of clinics (68%) are Federally Qualified Health Centers (FQHCs), nearly a third (30%) are in nonmetropolitan areas, and 29% serve populations with over 20% of uninsured patients. The longer clinics participate in the CRCCP, the greater the increase from baseline in their colorectal cancer screening rates. For example, clinics participating in the CRCCP for 2 years increased screening rates, on average, 8.3 percentage points.

EBIs and Sustainability

Awardees can implement up to 4 evidence-based interventions (EBIs) in clinics: provider and client reminders, removal of structural barriers, and provider assessment and feedback. A CDC study based on the first year of the CRCCP found that implementing 3 to 4 EBIs was associated with higher CRC screening rates.* Nearly 4 in 5 clinics implemented 3 to 4 EBIs after 3 years of participation. Sixty-three percent of clinics had at least one EBI considered to be sustainable after 1 year, 70% after 2 years, and 69% after 3 years.

% clinics with at least 3 to 4 EBIs in place

CRC Screening Champion and Policy

The CDC study also found that championing CRC screening or having a CRC screening policy was associated with higher CRC screening rates.* While the percentage of clinics with a screening policy (i.e., written clinic procedures to support screening) has increased among clinics with longer program participation, the percentage with champions has decreased.
